INSTALLATION INSTRUCTIONS

- Select where the ozone will be injected into the extraction system (canopy plenum or nearest ductwork), cut a 100mm hole and fit a 100mm spigot. Connect spigot to the ozone injector unit using 100mm tube, cut to length to prevent sagging and secure each end.
- Mount control panel unit on wall or riser duct as close to ozone injection point. Drill 6mmØ hole in extract ductwork and secure push-on pitot tube to the ductwork - position before the extract fan so that the pressure switch operates under a negative pressure. Run the clear plastic tube between the push-on pitot tube and the pressure switch connection on the unit.
- Connect to 1 off 240V\1 phase power supply per injector. Connect the control panel to the injectors with the cables provided, starting with socket 10\20 up to 70\80 as required.
- Turn the power on to the injectors and control panel; the injectors will be activated when the extract fan is started.
